It is especially used for cut, copy, and paste of large amounts of data without constantly switching between applications. Clipboard managers can also help to keep a history of copied data. Clipboard managers are usually software that runs on the computer operating system, and applications such as web browsers have built-in clipboard managers. There is also a class of applications called clipboard managers that run as stand-alone programs. Clipboard managers are usually accessible through the Edit menu of every application, which contains functions to copy, cut, and paste data to the clipboard. Some clipboard managers may also allow the user to automatically paste data to another program or web page after pasting it to the clipboard. In such cases, the copied data remains available for pasting for a short time. Clipboard managers are often used by people who work with multiple applications, and whose work involves extensive use of the clipboard, such as graphic designers or translators. One of the basic features of most clipboard managers is that they maintain a history of past clipboard operations so that data can be retrieved easily. Some clipboard managers are designed to work with operating systems that do not include a clipboard manager by default. For instance, instead of saving text in the clipboard, a user can copy it to the clipboard manager. Clipboard managers are often used to cut, copy, and paste program settings and results. Clipboard

Keyboard macros are one of the features of TextEdit in Mac OS X Lion, Mountain Lion, and Mavericks. These can be assigned by holding down a key combination and, after the keyboard has been activated, can be triggered automatically. RetroMacro is a free utility that allows you to define keyboard shortcuts and set them to execute either whenever a key is pressed or when some other event takes place. Thus, it is possible to have a keyboard macro that automatically switches to the next file in a list view when a number key is pressed, or to activate a tool in Excel when a specific key combination is hit. Furthermore, RetroMacro

allows you to store macro descriptions as strings, so it is possible to have an in-line comment on a keyboard shortcut. To use RetroMacro, you simply press and hold a key combination while the program is running. The key combination can be one of the 16 hotkeys, modifier keys, or any other key combination. Then, the program displays a dialog box that includes the name of the macro that will be performed, a description of the action, and a list of all keys that will be pressed. To finish, you simply select one of the keyboard macro actions and press the Enter key. You can even define several macros for a single key, and assign different actions to the same key combination. RetroMacro also comes with a script editor for creating keyboard macros from scratch. It is possible to write your own scripts and store them inside your project. Also, you can access the command line with its own RetroMacro interface, and perform operations there. RetroMacro is developed as a single developer project and is free for personal use.
