Field of the Invention The present invention relates to an image recording apparatus, an image forming apparatus, an image reading apparatus, and an image recording method. 2. Description of the Related Art An image recording apparatus such as an inkjet printer includes a unit (a cartridge) in which an ink tank and an inkjet head (a recording head) are integrated. The inkjet head is a recording head which can discharge ink from discharge ports. The inkjet printer allows the ink tank to be replenished with ink after the ink in the ink tank is consumed. A process of replacing the ink tank with a new one after the ink is consumed is referred to as "ink replacement". After the ink tank is replaced with a new one, the inkjet printer can perform printing of one page, which includes a printing process for forming an image with the ink jet head on a printing medium, and a conveying process in which the printing medium on which the image is formed by the inkjet head is conveyed. There are various types of cartridge models for printers, depending on the ink tank type, the number of recording heads included in the cartridge, and the like. There are several types of image recording apparatuses which can be applied to a cartridge type of which a cartridge used for printing contains a plurality of recording heads and one ink tank, and which has a mechanism for changing a cartridge mounted in the image recording apparatus depending on the type of the cartridge. For example, Japanese Patent Application Publication No. 2008-7583 discloses an image recording apparatus which specifies a type of cartridge (or a model of a cartridge) inserted into the image recording apparatus and displays a warning screen on a display unit in a predetermined manner, depending on the model of the cartridge. However, with a single color, it is difficult to determine whether an inserted cartridge is a color cartridge (for example
